## ALO 198H QUENCH

# ALO 198H QUICK QUENCH

### ALO 198H Quick Quench

The quick quench system consists of a blower and a cooling unit build in stainless steel. The quick quenching of the hot band is done by high volume of cool protective gas soaking the band. The gas is circulated in a closed loop system to avoid colorization or scale on the band. The hot gas is effectively cooled in a gas/water heat exchanger tank.

#### **Blower unit**

The blower head is equipped with blocks of nozzles that can be adjusted to match different band widths to optimize the quenching effect. The unit are equipped with a filter and are easy to open for service. The blower unit should be connected to the furnace muffle and are allowed to move on guides to self-compensate length vice for temperature related movements. It also allows larger side movements for service purpose.

#### **HIGHLIGHTS**

CE

- The system can be integrated to any existing hardening system where quick quenching of bands are needed .
- The system monitors airflow, water temps, in and outgoing gas temps giving a good overview of the process •
- Bands are quenched only with high velocity protective gas and no contact against the bands
- Air nozzle blocks can be adjusted for different band widths for most effective quenching
- Air pump can be regulated by means of a frequency controller to tune and keep electrical consumption low

#### **TECHNICAL SPECIFICATION:**

Band width: 12 - 80 mm (other widths on request) Band thickness: 0.9 - 1.6 mm Quench effect: 15-30 kW depending on system setting Voltage: 400 VAC, 3-phase, 50 - 60 Hz direct earthed system Power consumption average: 3,5 kVA Power consumption max: 9 kVA The system requiers an external coolant water source as well as an exteral protective gas source

#### Other customer requirements may be discussed between customer and ALO.

**SWEDISH QUALITY** WITH RESPECT FOR THE ENVIRONMENT AND SAFETY REGULATIONS
